

PC Backup

Do you have business critical information saved on your office computer? If you do and it isn't comprehensively backed up then you are at risk. Over half of businesses who lose data in a disaster never recover.

What is PC Backup?

PC Backup is a cost-effective solution for backing up all of your invaluable data. This easy-to-use software will ensure that in the event of a natural disaster, burglary, hard drive failure or in any other unforeseen circumstance, you will be able to restore all of your data to any computer that meets the minimum PC requirements and has a broadband connection.

Don't become a statistic

There are 1.5 million reported incidents of theft in the UK per annum with over 64,000 PC's reported stolen every year.

Other common reasons why businesses lose critical documents are:

- Hardware problem/failure – 56 %
- Human error (deleted or saved over) – 26 %
- Software corruption – 9 %
- Computer virus – 4 %
- Natural disaster (fire/flood) – 2 %
- PC/laptop theft – >1 %

Very few people remember that they should backup their data. Our online backup service is simple to use and automatically backs up your documents when you log off or shut down your PC, eliminating the issue of backing up your data.

Simply sign up online and set up a password, then you'll receive an email to download and install the software. Your work will be automatically backed up everyday, stored on our Data Backup servers and can be restored at your request.

With KC's generous 5GB and 20GB storage allowances, losing files need not be a time-consuming, nerve-wrecking or daunting event, ever again.

Our backup service was specifically designed with small businesses in mind, therefore it is as time efficient and simple to use as possible, whilst still providing you with the functionality you need from Data Backup software. Other PC backup services do not offer you the simplicity of performing an automated backup as you turn off your computer, or the ease with which you can select your files to be backed-up.
